

SUPPLEMENTARY PRODUCT RESULTS

ENVIRONMENTAL IMPACT RESULTS FOR PANEL AND ANCILLARY PRODUCTS

NU-WALL ALUMINIUM CLADDING

BOARDS – POWDER COATED

BOARDS – ANODISED

ANCILLARIES – POWDER COATED

ANCILLARIES – ANODISED

Valid from: 2024-08-31

Valid until: 2029-08-30

This document is not an EPD

As a values-driven business, we're on a continuous improvement pathway in new product development and environmental practices, choosing a manufacturing process that drives low-carbon and healthy new buildings. Having a local supply chain means minimal transportation carbon emissions and supply chain resilience.

Established in 1985, Nu-Wall® is one of New Zealand's leading aluminium cladding specialists, with products and systems designed and manufactured in New Zealand, enabling a reliable and resilient supply chain. Our core product – Nu Wall® Cladding – is a high-performance, low-maintenance and non-combustible BRANZ-appraised cladding system, with a 100-year base metal durability warranty. We are committed to providing innovative product designs that fulfil market needs in terms of aesthetics, functionality and sustainability.

Introduction

Nu-Wall powder coated and anodised products are used to clad a range of buildings, both residential and commercial. Board products are complemented by a range of ancillary profiles which, for example, provide a finish at corners, edges, and between building levels.

The following 76 product impact results are the outcome of Nu-Wall's product Life Cycle Assessment (LCA) conducted in 2024. These individual results are categorised within four Environmental Product Declarations (EPDs) that were generated from the LCA and published with [EPD Australasia](#).

While the published EPDs cover the Nu-Wall products contained in this document, only results for one representative product are able to be presented within each EPD. This document supports the published EPDs by providing the individual product impact results for all of the products assessed in the LCA study.

These results should be read in conjunction with the published Nu-Wall EPDs for a fuller understanding of the EPD process.

The Nu-Wall EPDs, (published 2024-10-09) with their registration numbers, are:

- Nu-Wall cladding – Boards – Powder Coated EPD-IES-0014123
- Nu-Wall cladding – Boards – Anodised EPD-IES-0014122
- Nu-Wall cladding – Ancillaries – Powder Coated EPD-IES-0014121
- Nu-Wall cladding – Ancillaries – Anodised EPD-IES-0014120

Nu-Wall EPDs can be downloaded from the EPD Australasia website:
<https://epd-australasia.com/epd-search/>

Relationship to EPDs

While the results information presented within this document supports the published Nu-Wall EPDs, it must be understood that this document is not an EPD, nor does it form any formal part or requirement of the published Nu-Wall EPDs.

However, the results are generated from an independent fully verified LCA process.

Declared Unit

ISO 14040 defines a functional unit as "quantified performance of a product system for use as a reference unit". EPDs that do not cover the full product life cycle from raw material extraction through to end-of-life use the term "declared unit" instead.

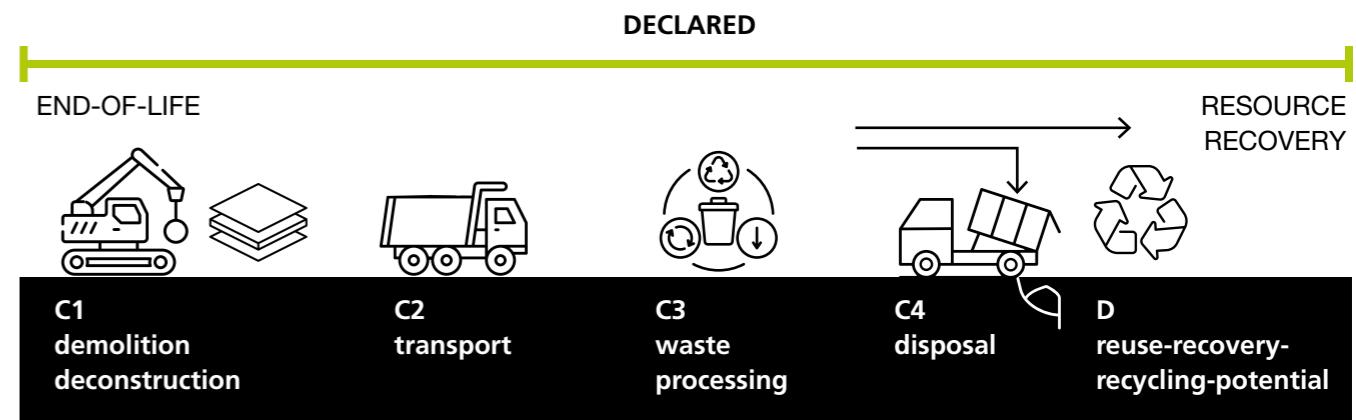

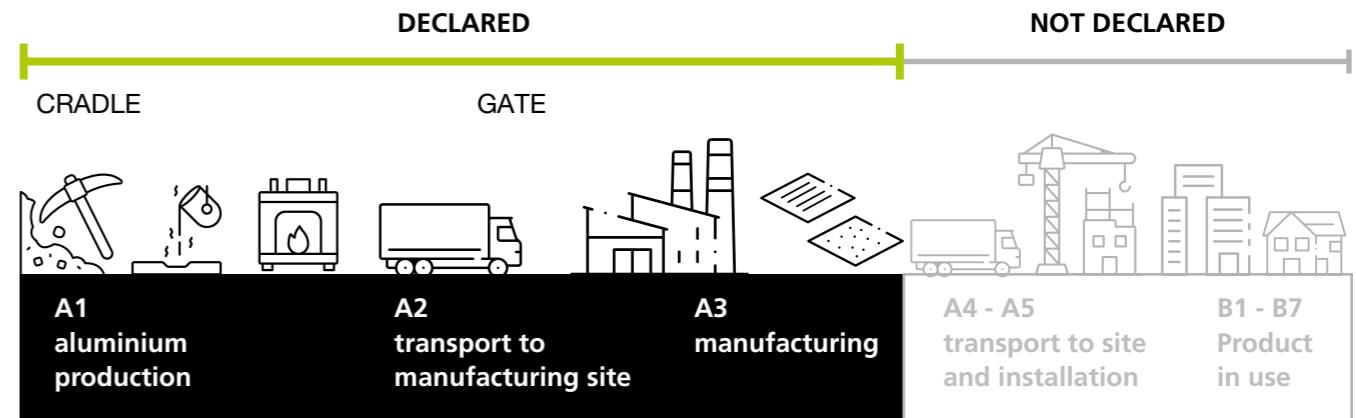

The declared unit for Nu-Wall board EPDs is: **one square metre (1 m²) of coverage, that being the amount required to provide a clad wall face of 1 m², including fastening clips.**

The declared unit for Nu-Wall ancillary EPDs is: **one lineal metre (1 LM).**

These declared units are typically specified quantities.

For further information on these results, the Nu-Wall EPDs, or Nu-Wall products, please visit www.nuwall.co.nz, or contact info@nuwall.co.nz.

NU-WALL'S DECLARED MODULES:

Core Environmental Impact Indicators

Climate change

(GWP-total, GWP-fossil, GWP-biogenic, GWP-luluc)
(Global Warming Potential)

A measure of greenhouse gas emissions, such as CO₂ and methane. These emissions are causing an increase in the absorption of radiation emitted by the earth, increasing the natural greenhouse effect. This may in turn have adverse impacts on ecosystem health, human health and material welfare. The Global Warming Potential (GWP-total) is split into three sub indicators: fossil (GWP-f), biogenic (GWP-b), and land-use and land-use change (GWP-luluc).

Climate change (ODP)

Depletion of the ozone leads to higher levels of UVB ultraviolet rays reaching the earth's surface with detrimental effects on humans and plants. The Ozone Depletion Potential is a measure of air emissions that contribute to the depletion of the stratospheric ozone layer.

Water use (WDP)

Water scarcity is a measure of the stress on a region due to water consumption.*

Abiotic Resource Depletion (ADPE, ADPF)

The consumption of non-renewable resources decreases the availability of these resources and their associated functions in the future. Depletion of mineral resources and non-renewable energy resources are reported separately. Depletion of mineral resources is assessed based on total reserves.*

Acidification potential (AP)

Acidification potential is a measure of emissions that cause acidifying effects to the environment. A molecule's acidification potential indicates its capacity to increase the hydrogen ion (H⁺) concentration in the presence of water, thus decreasing the pH value. Potential effects include fish mortality, forest decline, and the deterioration of building materials.

Eutrophication Potential

(EP freshwater, EP-marine, EP-terrestrial)

Eutrophication covers all potential impacts of excessively high levels of macronutrients, the most important of which are nitrogen (N) and phosphorus (P). In aquatic ecosystems where this term is mostly applied, this typically describes a degradation in water quality. Eutrophication can result in an undesirable change in the type of species that flourish and an increase in the production of biomass. As the decomposition of biomass consumes oxygen, eutrophication may decrease the available oxygen level in the water column and threaten fish in their ability to respire.

Additional Indicators

Resource use indicators

The resource use indicators describe the use of renewable and non-renewable material resources, renewable and non-renewable primary energy and water.

Note: Water consumption: The FW indicator in the EPD results tables reports consumption (i.e. net use) of 'blue water' (which includes river water, lake water and ground water). This indicator deliberately excludes consumption of 'green water' (rainwater), except for any additional water loss beyond what would occur in the original, natural system.

Waste material and output flow indicators

Waste indicators describe waste generated within the life cycle of the product. Waste is categorised by hazard class, End-of-Life fate and exported energy content.

Additional environmental impact indicators

Optional environmental impact categories provide further information on environmental impacts.

The results of the land use related impacts/soil quality indicator shall be used with care as the uncertainties on these results are high or as there is limited experience with the indicator.

The GWP-GHG indicator is identical to GWP-total except that the CF for biogenic CO₂ is set to zero. It has been included in the EPD following the PCR.

GWP-GHG (IPCC AR6) is an additional GWP100 indicator that is aligned with the Intergovernmental Panel on Climate Change (IPCC) 2021 Sixth Assessment Report (AR6) (IPCC 2023), national greenhouse gas reporting frameworks in Australia and New Zealand, as well as previous versions of the Construction Products PCR (PCR2019:14v1.11). It excludes biogenic carbon and indirect radiative forcing.

The ionizing radiation impact category deals mainly with the eventual impact of low dose ionizing radiation on human health of the nuclear fuel cycle. It does not consider effects due to possible nuclear accidents, occupational exposure nor due to radioactive waste disposal in underground facilities. Potential ionizing radiation from the soil, from radon and some construction materials, is also not measured by this indicator.

Biogenic carbon content

One kg biogenic carbon is equivalent to 44/12 kg CO₂.

Environmental impact (EN15804+A1) indicators

EN 15804+A1 Core environmental impact categories aid comparison and backwards compatibility with rating tools.

Please note:

The reported impact categories represent impact potentials, i.e., they are approximations of environmental impacts that could occur if the emissions would (a) follow the underlying impact pathway and (b) meet certain conditions in the receiving environment while doing so. The environmental impact results are therefore relative expressions only and do not predict actual impacts, the exceeding of thresholds, safety margins, or risks

Long-term emissions (>100 years) are not taken into consideration in the impact estimate.

The estimated impact results are only relative statements, which do not indicate the endpoints of the impact categories, exceeding threshold values, safety margins and/or risks. The use of the results of modules A1-A3 without considering the results of module C is discouraged.

*The results of this environmental impact indicator shall be used with care as the uncertainties on these results are high or as there is limited experience with the indicator.

Indicator abbreviations

Environmental impact EN15804+A2

| EN15804+A2 | | |
